

We need to have a page with a grid which renders JSON data in a table. Rows in a table should be filtered by dropdowns and any of columns can be sorted. Items in lists of dropdowns should be unique and sorted in the alphabet order and should be taken from the same JSON which we are using for the grid.

After a click to one any row, the popup should be displayed with additional data. Both buttons close popup. The text of the popup should be taken from separate JSON. The reason for this is that we have multiple languages support.

Layout should be responsive from 768px to 1600px.

Please use Vue.js.
